USDA-COTTON ANNEX
T.V.-11
RESULTS IN (ug/100cm^2)

United States Department of Agriculture
Office of the Secretary
Office of Operations
Washington, D.C. 20250

FEB 21 1996

Mr. William R. Lawson
Assistant Regional Administrator
Public Buildings Service
Washington, D.C. 20407

Dear Mr. Lawson:

In 1990 and 1991, the General Services Administration (GSA) accomplished construction contracts to replace all the PCB transformers in various transformer vaults in the Agriculture Building Complex. As part of these contracts, the contractors were provided guidance concerning decontamination and encapsulation of the transformer vault floors. Hill International, and the GSA contractor inspecting the projects, indicated that the contractors met all requirements indicated in a GSA guidance letter concerning PCB Decontamination Procedures. Therefore, the floors were painted as allowed by the guidance letter.

Subsequent to the vault floor painting, GSA had some concern that maybe all the transformer vault floors in the entire Washington, D.C. area have not been completely decontaminated. GSA had a contract to wipe test all the floors. The Agriculture vault floors were tested in late 1992. An additional three vaults were tested at a later date. A summary of the results show that the floors in the South Building vaults 13, 15 and 17, and in the Whitten Building (formerly the Administration Building) vaults 9 and 12 are not contaminated. All the remaining vaults, eleven in total, in the South, Whitten and Cotton Annex buildings show various degrees of contamination.

One of the findings indicated in an Environmental, Health and Safety Audit of the USDA Headquarters Complex, dated December 1994, indicated transformer vault floors were still contaminated with PCB. It is our understanding that since 1992, when it was confirmed that the vault floors were still contaminated, that a GSA project was being initiated to fix the problem.

In order to resolve an issue brought up in the aforementioned audit, it is requested that this office be informed as to the anticipated date of the much delayed removal of the contaminated concrete.

Your immediate attention to this matter is requested.

Sincerely,

PRISCILLA B. CAREY
Associate Deputy
for Operations

Ms. Priscilla B. Carey
Associate Deputy for Operations
Office of Operations
U.S. Department of Agriculture
Washington, DC 20250

Dear Ms. Carey:

This is in response to your letter of February 21, 1996, regarding PCB contaminated floors in the Agriculture Building Complex

We have numerous buildings in the National Capital Region where transformer vaults floors were found to be PCB contaminated. With the use of barrier mats and booties, the exposure to PCBs to workers entering the vault is negligible.

In regard to the cleaning of the vault floors, we have initiated a pilot project to evaluate decontamination procedures. The procedures developed in the pilot will be used to prepare the contract for decontamination of the remaining vault floors.

Currently, we cannot provide you with an anticipated date for mitigation in USDA vaults. Please be assured we will give USDA high priority and that we will continue to keep you informed of the status. If you have further questions regarding this matter, contact Mr. Fred Sission, Chief , Safety and Environment Branch (WPMOX), on (202) 708-5236, or by Fax on (202) 708-6618.

Sincerely,

(signed) James Bar

RADON SURVEY
Agriculture Annex Building (DC0004ZZ)
OMC Project #: 038-AGANNX-03

Performed For:

GSA-NCR-WPX
General Services Administration
Safety and Environmental Management
7th & D Streets, SW
Room 2036
Washington, DC 20407

Contract: #GS-P1187MJD-0030 Work Order: #P1189DC-5655

Attn: C. Williams

On November 15, 1989-, OMC placed 15 long-term radon detectors (total includes duplicates and blanks) in the Agriculture Annex Building located at 12th and Jefferson Drive, S.W., Washington, D.C. The detectors were placed on the basement and first floor levels (floors that are in soil contact) in order to determine exposure levels throughout the areas. The detectors were collected on February 10, 1989 and submitted for laboratory analysis.

Background

Radon is a naturally occurring inert radioactive gas emitted from the breakdown (radioactive decay) of uranium rock beds. Radon is also found in soils and rocks containing granite, shale, phosphate, and pitchblende, which are widely distributed in the earth's crust. Radon concentrations are expressed as picocuries per liter (pCi/l) of air. A picocurie is a widely used unit of measure in radioactivity.

Radon gas itself is not a major concern to human health. The problem is that radon continues to undergo radioactive decay, producing new naturally radioactive materials. These decay products, or progeny, which are solids, not gases, can attach to surfaces, such as dust

particles. The dust particles may be inhaled and deposited in the lung, damaging the tissue of the lung lining. Studies have indicated that the result of extended exposure to high levels of radon gas increases the risk of lung cancer.

Outdoor radon concentrations in the northern hemisphere are approximately 0.1 to 0.15 picocuries per liter (pCi/l). The concentration varies, according to barometric pressure, precipitation, time of day, local uranium presence, soil structure, and land use. Generally, outdoor radon is so diluted in the atmosphere it is of minor concern. But radon can diffuse through cracks and openings into the basements of buildings. The gas then becomes trapped in a comparatively small air volume. Because the radon in a building has less air with which to mix, indoor concentrations are usually higher than those found outdoors.

Radon gas does not readily form chemical compounds with other elements. Since it is not attracted to other chemicals, it diffuses through many materials. The gas can seep into buildings through cracks and joints in concrete floors, from soil-backed block walls in basements, and around pipes penetrating walls and slabs. Buildings with dirt floors or crawl spaces are particularly suspect.

The Environmental Protection Agency (EPA) has established a residential action level for radon of 4 picocuries of radon per liter of air. Concentration levels at or above 4 pCi/l require corrective action. The average winter concentration in U.S. homes is 1 to 2 pCi/l. An Action level for commercial or office building has not been established thus far.

Methodology

Detector Type

Long term samples were collected with alpha-tract detectors. Alpha-tract detectors consist of a small sheet of a special plastic material. The material is permanently marked when struck by alpha particles, which are emitted by the decay of radon gas. The detector is constructed to allow radon gas to diffuse into it, and then it records the natural decay of the captive gas.

After 90 days, the detectors were collected and returned to the manufacturer, Barringer Laboratories, Golden, Colorado, where the "tracks" on the plastic sheet were counted through a microscope. The tracks were converted to radon concentrations in pCi/l for the time of exposure. Barringer Laboratories is a participant in the EPA's Radon/Radon Progeny Measurement Profeciency Program.

Detector Placement

The GSA Sampling Protocol called for placement throughout the areas of the building in ground contact (below and on grade), with each detector covering no more than approximately 2,000 square feet. Detectors were placed in areas that were occupied, occupiable or routinely visited. They were placed in rooms expected to have low

ventilation rates, such as interior rooms with no windows and tight doors. Areas where cracks in walls or floors, where there were penetrations of walls or floors (e.g., pipes), areas with outside corners, and where construction or expansion joints were present were also tested. Blanks (unexposed) and duplicate samples were submitted as well.

For each detector, a "Radon Detector Location Questionnaire" was completed. The questionnaires and diagrams indicating the location of each detector are included in this report.

Results

All sample concentrations for radon were well below the EPA residential action level of 4 pCi/l. The detected levels of radon ranged from 0.2 pCi/l to 0.9 pCi/l. Since the average office occupant spends less time in the office than at home, response actions for this building are not necessary at this time. Analytical results and sample locations are summarized in the attached table(s).

Should you have any questions concerning this matter, please do not hesitate to contact this office.

Sincerely,

Timothy Sleeth
Industrial Hygienist

Re: Ninety-Day Radon Sampling

Site: GSA/Forrestal Building
Energy Child Development Center
1000 Independence Avenue, SW
Washington, DC 20585

AMA JOB # 42222

Dear Mrs. Eleazer:

On March 25, 1997, Amy Kehler of Aerosol Monitoring and Analysis, Inc. (AMA) was on-site to deploy radon detectors. On June 24, 1997, Amy Kehler of AMA returned to 1000 Independence Avenue, located in Washington, DC, to retrieve the detectors.

A total of ten Alpha Track radon detectors, which includes both blanks and duplicates, were placed throughout the daycare. Of the ten detectors placed, all ten were recovered. All of the radon detectors were 90-day samples.

Sample locations were selected by the AMA representative on site and are documented on the enclosed 'radon test detector log'. Note that the detectors were randomly placed in order to collect samples that were representative of the entire daycare center.

After the 90 day time period had lapsed, the detectors were collected and sent to Landauer located in Glenwood, Illinois for analysis. Landauer is a participant in the Environmental Protection Agency (EPA) sponsored Radon Measurement Proficiency (RMP) program.

The EPA has established an action level for radon of 4.0 picocuries per liter (pCi/l) of air. Of the ten samples recovered at 1000 Independence Avenue, none were found to exceed the 4.0 pCi/l action level (see table 1).

1331 Ashton Road • P.O. Box 646 • Hanover, MD 21076 • 410-684-3327 • FAX: 410-684-3724

Since all detectors analyzed were found to be less than 4.0 pCi/l, AMA feels that a low probability of significant health risks exist. Should you have any questions regarding this report, please feel free to contact our office.

Should you have any questions regarding this report, please feel free to contact our office at (410) 684-3327.

Sincerely,

Gary L. Urban

Notice of Disclaimer

Due to the limitations, constraints, inaccuracies and incompleteness of government information and computer mapping data currently available to InfoMap Technologies, certain conventions have been utilized in preparing the locations of all federal, state and local agency sites residing in InfoMap Technologies's databases. All EPA NPL and state landfill sites are depicted by a rectangle approximating their location and size. The boundaries of the rectangles represent the eastern and western most longitudes; the northern and southern most latitudes. As such, the mapped areas may exceed the actual areas and do not represent the actual boundaries of these properties. All other sites are depicted by a point representing their approximate address location and make no attempt to represent the actual areas of the associated property. Actual boundaries and locations of individual properties can be found in the files residing at the agency responsible for such information.

Waiver of Liability

Although InfoMap Technologies uses its best efforts to research the actual location of each site, InfoMap Technologies does not and can not warrant the accuracy of these sites with regard to exact location and size. All authorized users of InfoMap Technologies's services proceeding are signifying an understanding of InfoMap Technologies's searching and mapping conventions, and agree to waive any and all liability claims associated with search and map results showing incomplete and or inaccurate site locations.
